Creating a DataFrame with Shapes

- Each table for each route sheet has its own shape from starting stop to last stop.
- The shape is not complete because we don't have linestring of geographical coordinates between two consecutive stops for each table
- Hence, I used MapBox Direction API to generate these coordinates

Shapes.txt features

- Features:
 - shape_id: shape of the route
 - shape_pt_lat: Latitude of a point visited in the trip
 - shape_pt_lon: longitude of a point visited in the trip
 - shape_pt_sequence: Sequence number of the point in the shape

shapes=pd.DataFrame(columns=['shape_id','shape_pt_lat','shape_pt_lon','shape_pt_sequence'])

Overall Code

- Iterates over all route sheets and then creates temporary shape data frames for each subtables
- Each temporary shape data frames is appended into main shapes data frame

```
shapes=pd.DataFrame(columns=['shape_id','shape_pt_lat','shape_pt_lon','shape_pt_sequence'])
v for route in dfSuperSet.keys():
         c=pd.DataFrame(dfSuperSet[route]).iloc[:-1].dropna(axis=1,how='all')
         c=c.rename(columns={c.columns[0]:'stop_name'})
         index_list=c[c.isnull().all(axis=1)].index
         if route=='Mirzamurad-Chubpur-MARKAND 106':
         for i in range(len(index_list)):
                 temp['next_stop_coord']=temp[latlon].shift(-1)
                 temp=temp['next_stop_coord'].notnull()]
                 shape_point_sequence=0
                 temp_shapes=pd.DataFrame(columns=['shape_id','shape_pt_lat','shape_pt_lon','shape_pt_sequence'])
                 for k,v in temp.iterrows():

```

Code Snippets for creating a Data Frame with Shapes

- This code snippet converts an excel sheet containing information of one route into a pandas data frame. index_list stores indices where the rows are null (separating two subtables)
- DfSuperSet stores all excel sheets of all routes

```
c=pd.DataFrame(dfSuperSet[route]).iloc[:-1].dropna(axis=1,how='all')
c=c.rename(columns={c.columns[0]:'stop name'})
#gets the column name for coordinates
latlon=[col for col in c.columns if 'Latitude' in col][0]
#Keeps track of null rows between subtables
index_list=c[c.isnull().all(axis=1)].index
if route=='Mirzamurad-Chubpur-MARKAND 106':
    index list=index list[:3]
```

Code Snippets for creating a Data Frame with Shapes

• This function takes the coordinates of two consecutive stops of a shape and generates a list of geographical coordinates it will visit in between the two stops

Code Snippets for creating a Data Frame with Shapes

 This code snippet iterates through each table and call shape function for each consecutive stops. It then stores all the geographical coordinates between stops as rows and append it to main shapes data frame

```
#creates a temporary table for one shape
temp_shapes=pd.DataFrame(columns=['shape_id','shape_pt_lat','shape_pt_lon','shape_pt_sequence'])
#iterates through all stops visited in one shape and provides list of points between them
for k,v in temp.iterrows():
    #Get coordinates for the origin and destination stops
       stop coord = [float(n) for n in v[latlon].split(",")]
       next_stop_coord=[float(n) for n in v['next_stop_coord'].split(",")]
       shape_list_of_geometry = shape(stop_coord, next_stop_coord)
       temp_shapes=temp_shapes.append({'shape_pt_lat':shape_list_of_geometry}, ignore_index=True)
#create rows for each geographical coordinate visited between stops
temp_shapes=temp_shapes.explode('shape_pt_lat').reset_index(drop=True)
temp_shapes[['shape_pt_lon','shape_pt_lat']]=pd.DataFrame(temp_shapes['shape_pt_lat'].tolist(), index= temp_shapes.index)
temp_shapes['shape_id']=shape_id
temp_shapes['shape_pt_sequence']=temp_shapes.index
#appends this table into main shape table
shapes=shapes.append(temp_shapes).reset_index(drop=True)
shape_id+=1
```
